Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to a peptide conjugate having the formula:

(R.Yn-peptide where n = 1-10; X = C=0, when the R-Y group is attached to the N-terminus of the peptide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X = 0 or NH, when the R-Y group of the peptide, or OH; or X = 0 or NH, when the R-Y group is attached to the C-terminus of the peptide, or a side chain functional group is COOH or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one or two double bonds, cyclobutyl, cyclopentyl, cyclopentyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides AB37001-39736s represent analogues of the peptide portion of the conjugate. The peptides corresponding to amino acids 72-97 of the BH3 amain of the cell death agonist Bad. The peptide corrigate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell lymphoma/leukemia 2 (BCl-2)-mediated blockage of apoptosis in cancer cells. It is also useful for inhibiting BCl-2 cunticion. In particular, the peptide conjugate is useful for treating a subject apoptosis and an expensive an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  express Bol-2. The cancer includes prostate, colorectal, gastric, non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or acute or chronic lymphocytic and non-lymphocytic leadsenia. The peptide conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to a peptide conjugate having the formula:

(R-X)n peptide where n = 1-10; X = C=O, when the R-X group is attached
to the N-terminus of the peptide, or a side chain of the peptide where
the functional group of the side chain is NH2 or OH; or X = O or NH,
when the R-X group is attached to the C-terminus of the peptide, or a
side chain of the peptide, where the side chain functional group is COOH
or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylpatol containing one
or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylpatol containing one
or two double bonds, cyclobutyl, cyclopentyl, cyclobaxyl optionally
monosubstituted with a 1-SC straight or branched chain
c the peptide portion of the conjugate. The peptides represent examples
of the peptide portion of the conjugate. The peptides represent analogues
of the peptide portion of the conjugate. The peptide conjugate is
useful for modulating apoptosis in the calls of a subject, or for
reversing B cell lymphoma/lenkamia 2 (BBL-2)-mediated blockage of
apoptosis in cancer cells. It is also useful for inhibiting Bol-2
unction. In particular, the peptide conjugate is useful for treating a
subject affilicted with a cancer characterized by cancer cells that
express Bol-2. The cancer characterized by cancer cells that
express Bol-2. The cancer characterized by cancer cells that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or acute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; neuroprotective; anti-HIV; virucide; cerebroprotective; cardiant; Bcl-2 superfamily; BH3 domain; cell death agonist; Bad; apoptosis modulation; B cell lymphoma/leukemia 2; cancer; prostate; colorectal; gastric; non-small lung; renal; thyroid; neuroblastoma; melanoma; lymphocytic leukemia; neurodegenerative disorder; AIDS;
                                                                                                                                                 New peptide conjugates for modulating apoptosis or for inhibiting cell lymphoma/leukemia 2 (Bcl-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.

The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C-O, when the R-X group is attached to the roll of the peptide where to the Vibramius of the peptide, or a side chain of the peptide, or a side chain of the peptide, where the side chain of the peptide, or a side chain of the peptide, where the side chain functional group is COOH or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl contraining one or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl contraining one or CONH2; and R = 2-18C alkyl croppentyl, cyclopentyl, cyclopexyl optionally one mosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides ABB7001-B37058 represent amalogues of the peptide portion of the conjugate. The peptides represent amalogues of the BH3 domain of the conjugate. The peptide conjugate is of a Bcl-2 superiamily polypeptide corresponding to amino acids 72-97 of the BH3 domain of the coll death agonist Bad. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for eversing B cell lymphoma/leukemia 2 (Bcl-2)-mediated blockage of unction. In particular, the peptide conjugate is useful for treating a subject afflicted with a cancer characterized by cancer cells that cancer includes prostate, colorectal, gastric, on-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or cute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is a conjugate is conjugate is conjugate is conjugate in cancers, neuroblastoma, melanoma, or conjugate is also useful for treating disconjugate is conjugate is a conjugate in cancers, neuroblastoma, melanoma, or conjugate is also useful for treating disconjugate is a conjugate in cancers, neuroblastoma, melanoma, or conjugate is also useful for treating disconding a provisor of the peptide conjugate is useful for treating a neuroper conjugate is useful for treating a neuroper conjugate is useful for tr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                          New peptide conjugates for modulating apoptosis or for inhibiting B cell lymphoma/leukemia 2 (Bcl-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; neuroprotective; anti-HIV; virucide, cerebroprotective; cardiant; Bcl-2 superfamily; BH3 domain; cell death agonist; Bad; apoptosis modulation; B cell lymphoma/leukemia 2, cancer, prostate; colorectal; gastric; non-small lung; renal; thyroid; neuroblastoma; melanoma; lymphocytic leukemia; neurodegenerative disorder; AIDS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·

The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached to the vertical group of the spetide, or a side chain of the peptide where the functional group of the side chain is NH2 or OH; or X = O or NH, or X = COX NH2.

The functional group of the side chain is NH2 or OH; or X = O or NH, or X = O or X
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                       New peptide conjugates for modulating apoptosis or for inhibiting B cell lymphoma/leukemia 2 (Bcl-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; neuroprotective; anti-HIV; virucide; cerebroprotective; cardiant; Bcl-2 superfamily; BH3 domain; cell death agonist; Bad; apoptosis modulation; B cell lymphoma/leukemia 2; cancer; prostate; colorectal; gastric; non-small lung; renal; thyroid; neuroblastoma, melanoma; lymphocytic leukemia; neurodegenerative disorder; AlDS; stroke; myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.

The invention relates to a peptide conjugate having the formula:

(R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached to the N-terminus of the peptide where the functional group is attached to the C-terminus of the peptide, or a side chain of the peptide, where the side chain functional group is COH CC COMES; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides ABB7001-BB7058 represent analogues of the peptide portion of the conjugate. The peptides represent analogues of a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of the BH3 domain of the call death agonist Bad. The peptide conjugate is useful for modulating apoptosis in the cells of a subject, or for reversing B cell lymphoma/leukemia 2 [801-2), mediated blockage of unction. In particular, the peptide conjugate is useful for treating a conserses Bcl-2. The cancer characterized by cancer cells that express Bcl-2. The cancer characterized by cancer cells that express Bcl-2. The cancer characterized by cancer cells that express Bcl-2. The cancer includes prostate, colorectal, gastric, colored conjugate is also useful for treating a cute or chronic lymphocytic and non-lymphocytic and non-lymphocytic and non-lymphocytic and non-lymphocytic and conjugate is also useful for treating a conjugate is also useful for treating a colored and a conjugate is also useful for treating a colored and a conjugate is also useful for treating a colored and a conjugate is also useful for treating a colored and a conjugate is also useful for treating a colored and a col
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunostimulari; neuroprofective, noctropic, antiischaemic; vulnerary; cytostatic; antiviral; antiarthritic; antiinflammatory; wound healing; immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infertiity; lymphoproliferative condition; inflammation; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bcl-XL/Bcl-2 associated cell death regulator; BAD; mutant; apoptosis;
                                                                                                                                                                                                                                                                                                                                                          New peptide conjugates for modulating apoptosis or for inhibiting cell lymphoma/leukemia 2 (Bcl-2) function, especially useful for treating neurodegenerative disorders, stroke, or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 increased apoptosis, e.g. neurodegenerative disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;

The present invention describes an isolated or synthetic polypeptide

(1) comprising a less than full length amino acid sequence of a mutant

EDI-XL/BAD-12 associated cell death regulator polypeptide (BAD) or its

fragment, which contains amino acid substitutions at Serl18 of a human

BAD, Ser155 of a murine BAD (longer murine BAD) or Ser113 of a murine

BAD (shorter murine BAD). (I) has immunostimulant, neuroprotective,

nootropic, antilistaemic, vulnerary, cytostatic, antiviral,
antiarthrito, antiliflammatory and immunosuppressive activities, and

can be used as an apoptosis inducer or inhibitor. BAD polypeptides and

polymuclectides can be used for screening candidate compounds and drugs

for activity that promote cell survival or apoptosis. Other uses include

inducing or inhibiting apoptosis in a cell. Candidate compounds

indentified and (mutant) BAD polypeptides are useful in treating

immunodeficiency diseases, neurodegenerative diseases, ischaemic cell

death, reperfusion cell death, wound healing, cancer, viral infections,

lymphoproliferative conditions, arthritis, infertility, infamination and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Epitope; murine; bcl-x(L)/bcl-2 associated death promoter; Bad; stroke; polypebide; bcl-x; cell death; regulate; BHI; BHS; apoptotic cell death; cytokine deprivation; IL-3 dependent cell line; immunodeficiency; AIDS; neurodegenerative disease; senescence; ischaemia; neoplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     autoimmune diseases. The present sequence represents a specifically claimed shorter murine BAD mutant amino acid sequence from the present
                                                                                                                                                                                                                                                                                                                                             New mutant Bcl-XL/Bcl-2 Associated Cell Death Regulator polypeptide, useful for screening for candidate compounds which induce or inhibit apoptosis, comprises amino acid substitutions at Serl18, Serl55 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The present sequence is the murine BAD protein. Also described are: (1) fragments of mutant BAD protein. Also described are: (2) fragments of mutant BAD protein able to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, infarmation and autoimmune disease. Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease. Polynucleotide sequences continuants phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             phosphorylated BAD, by usual immunoassays: Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or ECL-XL but instead binds to 14-3-3 family proteins in the cytosol, thus promoting cell survival. The mutants with Ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; Fig 10; 95pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the murine bcl-x(L)/bcl-2 associated death promoter (Bad) gene. Bad is a 22.1 kD protein which interacts with bcl-2 and bcl-x proteins and regulates call death. It has homology to the bcl-2-related family clustered in the BH1 and BH2 domain. Bad has been found to hybridise to bcl-x(L) and bcl-2 in yeast two-hybrid assays and in vivo in mammalian cells. Overexpressed Bad counters the death inhibitory activity of bcl-x(L), but is much less effective at accelerate apoptotic cell death induced by cytokine deprivation in an IL-3 dependent cell line expressing bcl-x(L). Bad competes with Bax for binding death repressor activity of bcl-x(L). Bad competes with Bax for binding to bcl-x(L). Bad may be used to identify agents which inhibit its binding to bcl-x(L).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             to bal-2 or bal-x(L) to form heterodimers. Such agents may be treat neurodegenerative diseases, immunodeficiency diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polynucleotide encoding bcl-x(L)/bcl-2 associated death promoter useful to treat neoplasia and apoptosis and to identify agents inhibiting its binding to bcl-z or bcl-x(L) to form heteromultimers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Q
                                                                                                                                                                                                                                                                              The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 94 as sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD with a heterologous polypeptide that instend in the factor or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, inflammation and autoimmune disease. Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screening. BAD proteins phosphorylated at specified Ser are used to screening. BAD and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptosic status of cells is determined by measuring relative amounts of phosphorylated and non-phosphated BAD by usual immunoassays. Mutant BAD proteins have greater death-pronotting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heteroding the service of BCL-XL but instead binds to 14-33 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 12 and/or 186, relative to the murine BAD 204 as as equence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) fragments of mutant BAD protein able to decrease cell viability; (2) increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, Imphoproliferation, arthritis, infertility, and the gase and disease models or in fury screening. BAD proteins as disease models or in fury screening, and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischemic cell death. The apoptotic status of cells is adjugated and non-phosphorylated on the specified Ser, forming a product that does not phosphorylated cannot bind 14-3-3. Imminity cell survival. The mutants with expecting services in the cytosol, thus promoting cell survival. The mutants with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó

                                                                                                                                                                                                                                                                                                     death regulator) proteins, having an amino acid other than Ser at position 112 and/or 156, relative to the murine BAD 204 as sequence. The presents of mutant BAD protein. Also described are: (1) tragments of mutant BAD protein. Also described are: (1) tragments of mutant BAD with a heterologous polypeptide that conceases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infartility, infartilit

This sequence represents a novel serine-phosphorylated protein, BAD (BCL-X1)282-12 associated cell death regulator). The serine residue is phosporylated in a post-translational modification and allows binding to the 14-3-3 protein which is a signal transduction regulator.

Modulators of phosphorylated BAD, which act through inhibition/activation of a phosphoserine phosphatase, are useful for preventing/treating increased/decreased apoptors! In a cell. The increased apoptors may result from immunodeficiency diseases, senseonce, neurodegenerative disease, ischaemic cell death, repetfusion cell death, infertility and wound-healing. Decreased apoptosis may result from cancer, viral infection, lymphoproliferative conditions, arthritis, infertility, inflammation and autoimmune diseases. Measuring the amount of phosphorylated compared to unphosphorylated BAD polypeptide and/or total BAD in a cell is useful for determining the apoptotic state of a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunostimulant; neuroprotective; nootropic; antiischaemic; vulnerary; cytostatic; antiviral; antiarthritic; antiinflammatory; wound healing; mamunosuppressive; apottosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infertility;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bcl-XL/Bcl-2 associated cell death regulator; BAD; mutant; apoptosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                       Serine-phosphorylated Bcl-X-1/Bcl-2 Associated cell Death regulator polypeptide - useful for modulation of apoptosis associated with, e.g. cancer and immunodeficiency diseases

                                                                                                                                                         The present invention describes an isolated or synthetic polypeptide (I) comprising a less than full length amino acid sequence of a mutant Bel-XL/Bel-12 associated call death regulator polypeptide (BAD) or its fragment, which contains amino acid substitutions at Seril3 of a human BAD, SeriS5 of a murine BAD (longer murine BAD) or Seril3 of a murine BAD (and the acid of a mutine BAD) or seril3 of a murine BAD (and the acid of a mutine BAD) or seril3 of a murine BAD (and the acid of a mutine BAD) or seril3 of a murine BAD (and the acid of a mutine BAD) or seril3 of a murine BAD (and acid of a mutine BAD) or seril3 of a murine BAD (and acid of a mutine BAD) or series of a mutine BAD (and acid of a mutine) or inhibitions an apoptosis induced or inhibitor. BAD polypeptides are useful in treating inducing or inhibiting apoptosis in a cell. Candidate compounds indentified and (mutant) BAD polypeptides are useful in treating immunodeficiency diseases, neurodegenerative diseases, ischaemic cell cath, wound healing, cancer, viral infections, lymphoproliferative conditions, arthritis, infertility, inflammation and cutolimmune diseases. The present sequence from the present

                                                                                                                                                                                                                    The present invention describes a method (MI) for inducing apoptosis in a cell infected with herpes simplex virus (HSV), which comprises administering to the cell, a composition having an agent that inhibits phosphorylation of pro-apoptotic polypeptide BAD by HSV US3. Also described is a method (M2) for treating a patient infected with HSV, by administering to the patient, a composition comprising a peptide comprising a sequence of 4-NO continuous amino acids of a 168 residue amino acid sequence (see ABR39081), where the peptide comprises serils, or ser155, or their combinations. BAD has virucide activity. MI is useful for inducing apoptosis in a cell infected with HSV, where the cell is in a human. M2 is useful for treating a patient infected with HSV. The present sequence represents murine BAD, which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse; Bad-DTTR; apoptosis; cancer; spinal muscular atrophy; diptheria toxin receptor binding domain; DTR; neoplasm; tumour; hyper-proliferation; Alzheimer's disease; neurodegenerative disorder; transient isobaemic neuronal injury; stroke; spinal oord injury;

```
Novel fusion protein for modifying apoptosis in target cell and reducing apoptosis after transient ischaemic neuronal injury, has two domains which targets protein to a cell and modifies apoptotic response of cell -
                                                                                                                                                                                                                     Claim 4; Page 59-61; 65pp; English.
```

The sequence represents the amino acid sequence of Bad-DTMR apoptosismodifying fusion protein comprising Bad gene sequence fused via a short
continued apoptosis-modifying fusion protein is capable of binding a
target cell and integrating into or crossing a cellular membrane of the
carget cell and integrating into or crossing a cellular membrane of the
carget cell and integrating into or crossing a cellular membrane of the
continued apoptosis-modifying fusion protein comprises at least
two domains: the DTM domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities an apoptotic response
continued the Bcl-XL domain, which medities are proported as Abjective and the Bcl-XL transient ischaemic neuronal injury,
continued as Alzheimer's disease, Huntington's disease, spinal muscular
atrophy, stroke episodes and unrequiated cell growth as in tumours and
cutoptotic representative body and targeted to selective tissue and

Sequence 1077, Application US/10238075
Publication No. US20030148324A1
GENERAL INFORMATION:
PERIOD NO. US20030148324A1
GENERAL INFORMATION:
TITLE OF INVENTION: Polynuclectides which are of nature B2/D+ A- and which are isc
TITLE OF INVENTION: E.coll, and biological uses of these polynuclectides and of 1
FILE REFERENCE: BLANDINE
CURRENT APPLICATION NUMBER: US/10/238,075

Hamner S., Arumae U., Yu L.-Y., Sun Y.-F., Saarma M., Lindholm D.;

"Functional characterization of two splice variants of rat BAD and
their interaction with Bcl-w in sympathetic neurons.";

Mol. Cell. Neurosci. 7:99-106(2001).

-! FUNCTION: Promotes cell death. Successfully competes for the
binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level
of heterodimerization of these proteins with BAX. Can reverse the
death repressor activity of Bcl-x(L), but not that of Bcl-2 (By
similarity). Appears to act as a link between growth factor
receptor signaling and the apoptotic pathways.

-! SUNGNIT: Forms heterodimers with the anti-apoptotic proteins, Bcl-
x(L), Bcl-2 and Bcl-w. Also binds protein SlOADIO. The Ser-
-! SUBCELLUARS LOCATION: Outer mitochondrial membrane. Upon
phosphorylation, locates to the cytoplasm (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Name Decreases and tissues tested, including brain, liver, spheen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the more abundant form.

-!- DOMAIN: Intact Ball domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apototic members of the Bcl-2 family.

-!- PIM: Phosphorylated on Ser-113 in response to survival stimuli.

Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-166, a site within the BH3 domain. leading to the release of Bcl-x(L) and the promotion of cell survival.

Ser-137 is the major site of AKTVPKB phosphorylation, Ser-156 the major site of Protein kinase A (CAPK) phosphorylation (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LPRPKSAGTATOMRÓSASWTRIIOSWWDRNLGKGGSTPSQ

- GUSCELLULAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.

- TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.

- DOMAIN: Intract BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

- PTM: Phosphorylated on Ser-75 in response to survival stimuli. Subsequent phosphorylation on Ser-99 promotes heterodimerization with A-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-118, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival.

Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 the major site of protein kinase A (CAPK) phosphorylation (by

1- FUNCTION: Probable transcription factor involved in the genetic control of flower development. Is required for normal development of petals and stamens in the wild-type flower. Forms an heterodimer with PISTILIARA that is required for autoregulation of both Ap3 and PI genes. AP3/PI heterodimer interacts with APETALA or SEPALMARA to form a ternary complex that could be responsible for the regulation of the genes involved in the flower
                                                                                                                                  Krizek B.A., Meyerowitz B.M.;
